1.0 Introduction

1.1 Background

This preliminary engineering report was prepared pursuant to meeting the preliminary engineering report requirements given in Section 411 of IDAPA 58.01.16, better known as the Idaho Wastewater Rules (hereinafter called Wastewater Rules).

The technical portion of the City of Cascade's Sewer Facility Planning Study (Project Engineering Consultants; Schiess & Associates) was completed and approved by DEQ on March 29, 2011. Since that time, the City replaced thousands of feet of old sewer mainline in an effort to eliminate infiltration and reduce the hydraulic loading on the treatment plant. The collection system project included replacement of the final lift station located near the lagoon treatment plant. This is the sum of all of the wastewater improvements that the City has done since the completion of the Sewer Facility Planning Study.

All three lagoon cells were leak tested in 2011 (Strata). The results of these tests showed that the liners of each cell are each within the allowable leakage limit of 1/4 inch per day. It is safe to assume that each of these lagoon cells will continue to test within allowable limits in the future.

The NPDES permit remains administratively extended since January 1, 2009. BOD and TSS discharge requirements are typical of a low impact lagoon system like Cascade with an 85 percent removal requirement and 30 mg/L average monthly discharge concentration limit. Currently phosphorus and ammonia are being monitored as per Table 1 of the City of Cascade NPDES discharge permit.

The City of Cascade now desires to turn their focus to incrementally improving the efficiency and the reliability of treatment at the wastewater treatment plant by adding a minimum amount of aeration and a vertical fine screen.

1.2 Purpose

In visiting with the DEQ Boise Regional Office about the desire of the City to initiate self-funded treatment plant improvements, a discussion ensued about whether the facility plan should be updated or merely writing a preliminary engineering report would be sufficient prior to submitting design plans and specifications. Sound reasoning about this issue resulted in the conclusion that if the City stopped receiving septage as was reported in the approved facility plan, then there was really no need to update the facility plan at this point (Ryan). Subsection 520.01 of the Wastewater Rules states that prior to acceptance of sewage at a wastewater treatment plant, the plan for doing so must be addressed in a facility plan. As a response to this and for many other good and valid reasons, the Cascade City Council in council meeting held on February 27, 2017 voted in favor of permanently ending the acceptance of septage. This is now official City policy.

Much of the collection system improvements identified in the facility plan have been made. But the treatment aspects of the facility plan are not outdated, remain in force and still provide a capital plan for treatment plant improvements. Since the balance of the facility plan remains

valid without the consideration of septage, then a preliminary engineering report for treatment plant improvements is a reasonable next step to initiate improvements. This report is intended to meet this requirement.

1.3 Scope

This report is focused on minimum aeration improvements to the three existing facultative lagoon cells. We also touch on the vertical Huber screen that is to be fitted in the final lift station wet well. No other aspect of treatment plant improvements is included such as the removal of nutrients. No attempt is made as part of this report to design for unknown and potentially possible future NPDES nutrient limits.

Since much of the infiltration was removed as a result of the aforementioned collection system and final lift station improvements, it is important to study the reduced treatment plant influent flow, BOD and TSS and nutrient data recorded since commissioning to document changes to the flow stream and its constituents. This will enable more sound aeration improvement recommendations to be made. Thus, Table 3.1 and Table 6.1 of the facility plan will be effectively updated in regards to influent flow, BOD and TSS and nutrients. The need/lack of need for treatment of ammonia and phosphorus will be only lightly addressed.

Lastly, estimates of probable cost will be given for the recommended improvements. These costs will be based on the City using local funds only and working with local contractors. These cost estimates will update the applicable elements of Table 5.4 in the facility plan given on pages 88 and 89 and the associated discussion under subheading 5.1.4 Partial Mix Lagoon with Mechanical Aerators (Alternative 2).

2.0 DESIGN CRITERIA

At City request, we examined the 20 year and buildout conditions in terms of the number of homes added to the City wastewater collection and treatment systems. Using homes makes the projections easier understood. By using the number of homes added, we can set a baseline of flow for current conditions which encompasses homes, businesses and infiltration. Then we incrementally project flow, BOD and TSS into the future based on accepted flowrates and loading rates on a per person basis. We used 0.2 lbs/person/day for BOD and TSS and 100 gpcd for flow. The future conditions of adding 50 homes, 165 homes and 200 homes were considered. This report, like the facility plan, uses an addition of 500 permanent residents as the future design target. This translates to 200 new homes assuming 2.5 people per home.

For the purposes of this report, the build-out condition of 0.72 MGD average daily influent flow in the peak month of the year is too far in the future to warrant consideration in this report. No consideration of buildout would be reasonable without a new NPDES discharge permit that identified nutrient treatment requirements. Refer to Section 3.3 of the facility plan for a discussion of the build-out capacity of the system. No further discussion of the hydraulic design capacity of the WWTP is undertaken.

2.1 Current Wastewater Flow Rates

Current wastewater flow rates are described on the graph given as Figure 1 on the following page. The data were collected from the commissioning of the new lift station in November 2014 to February of 2017. The information given on Figure 1 is numerically expressed in Table 1 below.

Table 1 – Current Influent Flow Rates						
				Conditions		
		Unit	Winter	Summer		
Population	on	People	1004			
INFLUEN [®]	T FLOW	·				
	Average Day	MGD	0.23	0.14		
	Average Month	MGD	0.24	0.14		
*	Maximum Month	MGD	0.49	0.19		
**	Maximum Day	MGD	1.36	0.24		
	Avg/Day Person	Gallons	233	143		

Table 1 - Current Influent Flow Rates

Comparing Figure 1 with Figure 2-6 in the facility plan illustrates that the baseline flow in October has dropped 0.15 MGD from approximately 0.26 MGD to 0.11 MGD. Comparing Table 6.1 of the facility plan to Table 1 below illustrates that maximum month flow has decreased 0.38 MGD from 0.87 MGD to 0.49 MGD. The maximum day flow remains the same at 1.36 MGD indicating that the maximum day flow is influenced mostly by inflow during spring melt rather than infiltration. Average daily flow has decreased 0.15 MGD from 0.34 MGD to 0.19 MGD (average of winter and summer in Table 1).

^{*}Winter maximum month occurred in 2/17

^{**}Winter maximum day occurred on 2/10/17, Summer maximum occurred on 7/4/16

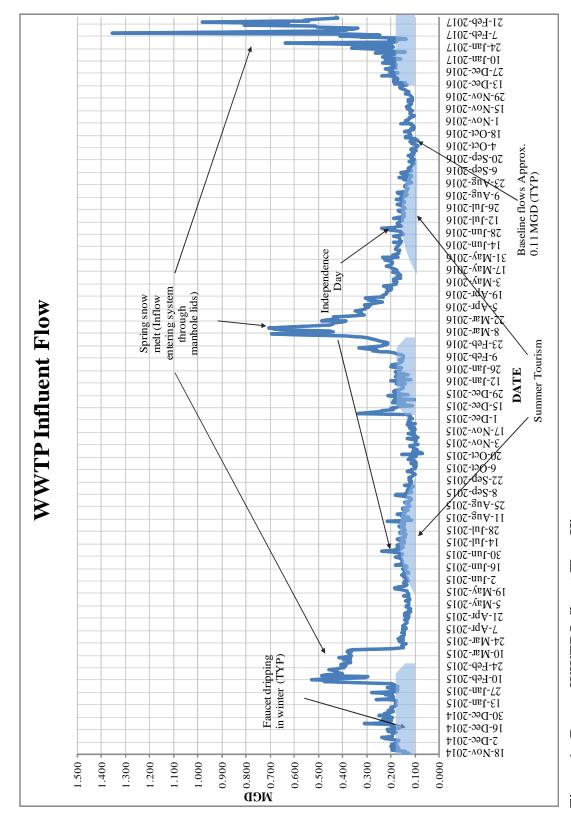

Figure 1 - Recent WWTP Influent Flow History

Inflow is heavy during spring melt. Entry is most likely through the holes around the rims and through the lids of low lying manholes. We believe that there remains approximately 0.01 to 0.03 MGD of infiltration that finds its way into the collection system each day and comprises part of the base flow of 0.11 MGD and all of the flow metrics in Table 1.

Peak hour flow rates are not shown in the table. The peak hour flow rates measured by the lift station flow meter are limited by the capacity of the final lift station pumps acting together drawing water out of the pump station and into Cell 1. This is estimated to be 1,640 gpm or 2.36 MGD. Peak hour flow rates in this case are not used for the design of the aeration system, but are used for the selection of the vertical screen to be installed in the lift station wet well. A pump curve of the final lift pumps with a hand-sketched parallel pump operation curve assuming both pumps are running illustrate the 1,640 gpm maximum flow rate of the system. This pump curve for the lift pumps is provided in Appendix B.

2.2 Estimated Future Flow and Constituent Loading Rates

Figures 2 and 3 give BOD and TSS loading at the WWTP over the same time period as the flow data in Figure 1. Table 2 gives estimated future flow rates and TSS and BOD loading rates.

Table 2 – Estimated Future Influent Flow Rates, TSS and BOD Loading

The BOD and TSS data were taken over a period of time where the City allowed the acceptance of septage into the WWTP. Therefore the estimated amount of BOD and TSS expected at the WWTP, in terms of pounds and concentration, is overestimated in this table, but it is the best information available and conservative when considering future loading to the WWTP.

Septage volumes provided by the City for the period of June 2014 to June 2015 and included in Appendix A indicates, using an assumed standard septage BOD of 7,000 mg/L, that septage

was contributing as little as one pound of BOD into the system per day in the winter months to as high as 50 pounds per day in the summer. This amount of BOD loading is equivalent to the loading of 100 homes.

The era of not accepting septage has just begun so there is not available data to consider the loading reduction to the WWTP that does not include septage. The maximum month concentration data for BOD and TSS was not estimated for the future because we believe the existing data are high due in some measure to septage. There seemed to be no good way to estimate the future without using available sampling and testing data as a basis. The next best thing would be to throw out available data and resort to using accepted national loading rates. Nationally accepted BOD and TSS concentrations for a typical city under normal conditions are 220 mg/L for BOD and TSS in literature (Metcalf and Eddy, Inc.). The maximum month pounds of BOD and TSS from the sampling and testing data coupled with adding 0.2 lbs/person per day of BOD and TSS for the impact of new homes were used in the calculations for determining aeration requirements to be conservative. The effect of using existing high BOD and TSS values had minimal impact in determining aeration requirements.

Figures 2 and 3 illustrate that the average monthly pounds of BOD and TSS sent to the WWTP is the highest in the summer time. With or without septage, this is expected because of the tourist impact and the summer dumping of RV waste at Harpo's. The running of water faucets in the coldest months and the inflow that occurs at spring melt increases the winter flow and dilutes the sewage (BOD, TSS and nutrient concentrations) in the winter.

The future average loading rates show a gradual increase from the present. With every new home added, the concentration of BOD and TSS should increase slightly as the diluting impact of remaining infiltration and winter faucet dripping slowly diminish for winter time loading. Summer trends should remain about the same less the periodic shock impact of septage like what appears to have occurred in October of 2015.

A review of Cell 3 effluent testing results reveals that the highest ammonia concentrations from Cell 3 occur in the late winter during spring melt when flows are the highest. This was reported to the City in the WWTP and River Monitoring Results prepared by Schiess & Associates in 2009 (Schiess & Associates). The Cell 3 effluent results for ammonia and phosphorus from December 2014 to February 2017 are given in Appendix A. Again, the highest ammonia concentrations occur in the late winter during spring melt when flows are the highest. The later dataset has a high of ammonia of 19.9 mg/L and the earlier dataset has a high of 13.0 mg/L. Both datasets trend similarly. Perhaps the later data set has a higher concentration than the earlier dataset because the maximum month sewage volume is 56 percent of what it once was (.49 MGD/.87 MGD)*100). Similarly, concentration of ammonia in the sewage has increased 53 percent (19.9/13.0 - 1)*100) during the maximum month which corresponds to the spring melt period.

The high influent loadings for BOD and TSS shown on Figures 2 and 3 for the month of October 2015 were thrown out as anomalies related primarily to septage. This month relates to

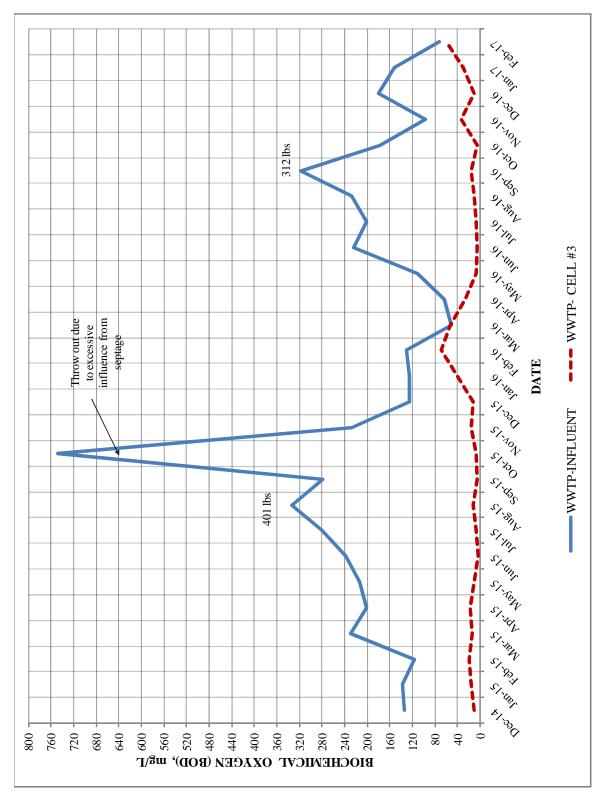

Figure 2 - Monthly BOD Loading at WWTP

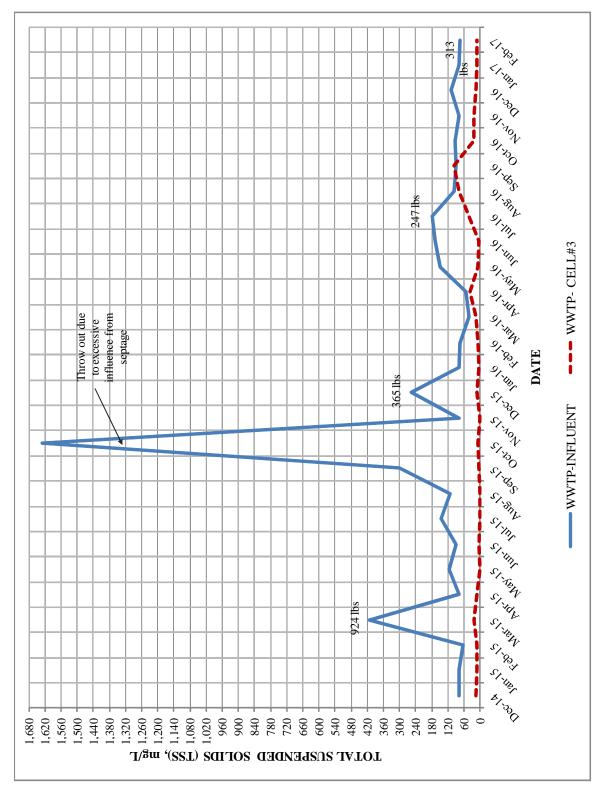

Figure 3 - Monthly TSS Loading at WWTP

a time when forest fires were rampant in the region and significant septage dumping into the WWTP occurred to support the efforts of firefighters.

Note also the smaller spikes of BOD and TSS that occur in the late winter and fall for Cell 3. The late winter BOD spikes appear to be related to turnover and the fall TSS spikes are likely related to the presence of algae. We will discuss more of this later in this report.

2.3 Effluent Requirements

Effluent requirements have not changed since the current NPDES permit became effective in 2004. This permit remains active via administrative extension and will remain so until the EPA issues a new permit. Effluent requirements of the permit are given on Table 1 in the permit and on page 17 of the facility plan. These include influent flow, BOD, TSS and effluent BOD, TSS, E. Coli and temperature. The BOD and TSS effluent limits are 30 mg/L and 180 lbs/day average monthly limit and 45 mg/L and 270 lbs/day average weekly limit. Ensuring that the treatment plant has ample room for additional sewage treatment for several decades without extraordinarily high capital improvement costs is our aim.

No permit limit exists for ammonia and phosphorus. Monitoring is required. It remains to be seen what the next permit will require for these nutrients. At worst, it is expected that the limits will be lenient enough to allow the City to keep its lagoons as a viable treatment process, although some alterations may be needed. Disinfection in some form will also certainly be required. Perhaps ultra violet light disinfection could be considered to ensure that the rapid sand filters remain biologically active as designed.

The North Fork of the Payette River (hereinafter called River) has been assigned a Total Maximum Daily Load (TMDL) only for sediment in the North Fork Payette River Subbasin Assessment and TMDL (IDEQ). Phosphorus was delisted at the same time because beneficial uses in the River are not impaired by the low phosphorus levels present in the River. Temperatures exceed the temperature standard primarily from warm water leaving Cascade Reservoir, but canopy cover meets target levels, so a TMDL for temperature was not developed. A TMDL for sediment was developed, but the entire allocation went to non-point sources (IDEQ). Future permit limits expected for the WWTP remain as described in Section 3.3 of the facility plan (Project Engineering Consultants; Schiess & Associates) and herein.

Furthermore, with the sand filter remaining functional and active in the treatment train, the WWTP effluent hardly ever directly discharges into the River. When discharge does occur, the discharge water comes from the sand filter underdrain system. This WWTP filtered effluent water (filtrate) only flows overland out of the sand filter underdrain system when the groundwater surrounding the WWTP rises sufficiently to mix with the sand filter filtrate. The mixture of groundwater and filtrate then flows overland several hundred feet into the River. Direct discharge into the River with the groundwater/filtrate mixture has not occurred since 2006 (Yamamoto).

2.4 Aeration Design Criteria and Calculations

The aim of the floating mechanical aspirators is to add mixing capability to the lagoon system and improve the dissolved oxygen level to a minimum of 1.8 - 2.0 mg/L in all the ponds as per the requirements of Subsection 493.06.d in the Wastewater Rules.

It is apparent by studying the dissolved oxygen (DO) test results from Cell 3 that DO ranges from 0 mg/L to as high as 4 mg/L naturally. This was realized by reviewing test results provided to us by the system operator over the period from November 2014 to February 2017. It is generally accepted that most wastewater treatment lagoons, without some form of aeration, are mixing limited, not oxygen limited. These lagoons tend to be limited about the same with oxygen tending toward being the primary limiter. The addition of mixing and oxygen using mechanical aspirators is a generally accepted improvement technique to raise dissolved oxygen levels to 2 mg/L in each facultative lagoon cell and thus improve treatment of BOD and TSS. The aspirator technology best achieves this in shallow lagoons like the City's three lagoon cells. The action of the aspirator will not have an erosive effect on the clay seal at the bottom of the lagoon cells.

The loading rates for BOD and TSS are given on Table 2 were considered when making the aeration calculations in this report. The aeration calculations are provided in Appendix B. Aeration Industries prepared the calculations based on input from the author. These calculations aid in determining needed equipment to fulfill oxygen and mixing requirements of the wastewater. Theoretical calculations for summer and winter conditions to predict BOD removal are also given. Each indicates that adequate reduction of BOD and TSS should occur with the recommended amount of floating aspirating aeration equipment. Forty horsepower of aspirating aeration equipment divided among the three lagoon cells is recommended.

2.5 Vertical Fine Screen Design Criteria

The important design criterion for this screen is that it can screen the maximum flow rate entering the lift station wet well from the gravity collection system. The maximum flowrate can be assumed to be the same or nearly the same as the capacity of the lift station pumps when both are running. This was calculated to be a maximum of 1,640 gpm or 2.36 MGD by estimating the combined flowrate of both lift station pumps running together. The graphical method of doing this is illustrated with the lift station pump curve given in Appendix B.

3.1 Currently Proposed Facilities for 20 Years Conditions

As described in Section 2.0, for the purpose of this report, the 20 year design condition is assumed to be the addition of 200 homes from the present condition and the buildout condition is too far into the future to be relevant at this time. The addition of 200 homes yields a non-transient population of 1,500 and a summer population of 2,000 or more. The added amount of tourist influence, although factored into the design and recommendations of this report through heavier summer BOD and TSS loading, do not play a significant role in the aeration recommendations given in this report due to the inherent benefits of lagoon operations coupled with aeration during summer and fall months.

A plan view preliminary drawing showing the recommended improvements is given in Figure 4. No discussion of adding 50 homes or 165 homes is given due to the need to supply minimum aeration to achieve noticeable improvement in treatment, which requires 40 horsepower of the type of recommended aeration equipment. Minimum aeration in these ponds with lots of hydraulic residence time (98 days average in the summer and 43 days in the winter) made available with reduced infiltration and inflow warrant the addition of a minimum of 40 horsepower of aeration.

Aeration and mixing added to each of the three lagoon cells will provide immediate treatment improvement. The operators should see a noticeable effect of reduced BOD effluent results and odor at seasonal turnover (when the ice on the surface of the lagoons melt off and the warmer water near the bottom of the lagoons during the winter changes places with the warming water on the top of the lagoons as winter gives way to spring) in the late winter and in the later fall when cooler lagoon surface temperatures tend to change places with the warmer water at the bottom of the lagoons (See Figure 2). A similar trend should be noticeable with reduced Cell 3 TSS concentrations in the summer and fall when algae blooms historically were the likely culprit for raised concentrations (See Figure 3).

The vertical fine screen is a one-time installation item that will function for current flows all the way to buildout of the capacity of the entire WWTP. No more discussion of this unit is given in this chapter.

3.2 Treatment During Construction

Since the addition of floating mechanical aeration can be added without interfering with the flow stream, there are no harmful effects to treatment during construction. New electrical conductors will be installed in the lagoon berms as necessary to provide power to each floating aerator. Deadman type concrete filled and backfilled steel posts with cable ties will be used to hold the floating aspirators in place. The floating aspirators will be set in place and the cables strung from one side of each lagoon to the other using a rowboat.

To install the fine screen, the lift station will need to be temporarily bypassed. This should be done in late September and October when collection system flows into the lift station are at a minimum. The manhole invert on the downside 10 feet upstream from the wet well of the lift station can be plugged with a sewer plug. Bypass pumping equipment can then be installed in

the manhole and pumped using a portable hose to the camlock fitting connection inside of the lift station dry well. Refer to the lift station record drawings and O&M manual for additional information. As soon as the fine screen is set, normal flow through the lift station can resume.

The screen can be fitted for easy removal using a slide rail system. Through evaluation of the record drawings it is apparent that there is adequate room for the screen to be installed on a slide rail system. The screen installed on a slide rail system would be much easier to retrieve for maintenance.

4.0 PROCESS UNITS

4.1 Current, Twenty Year and Buildout Conditions

As described in Section 3 of this report, the aeration needed for 200 or fewer homes are given below. Due to the benefit of a limited aeration amount of 40 horsepower, there is no value to consider the amount of aeration for treatment of 50 homes or 165 homes. The size and number of units needed for each lagoon are given.

Cell 1: (4) 5 Hp Aire-O₂ Aspirating Aerator from Aeration Industries or equivalent Cell 2: (2) 5 Hp Aire-O₂ Aspirating Aerator from Aeration Industries or equivalent Cell 3: (2) 5 Hp Aire-O₂ Aspirating Aerator from Aeration Industries or equivalent

Once the aeration is functioning, the viability of how many homes can be added over time will begin to be apparent. Perhaps more than 200 homes could be added. There will likely be a continued limited amount of nitrification of ammonia in the summer months since the aerated lagoons will be underloaded and aeration is provided at a minimal level. Very little nitrification is expected in the winter months due to the low temperature of the water. Phosphorus removal of about 10 to 20 percent may occur (EPA).

4.2 Redundancy

As a precautionary measure, it would be desirable for the City to have on hand spare parts. This will limit the loss of a portion of the aeration and mixing to hours or a day for maintenance. A partial loss of aeration seems reasonable since design is based on peak month and it will not be necessary to run all the aerators all of the time. Operator knowledge gained over time will determine how many aerators to run and how often. The controls should include shut-off and timers to regulate the amount of operation of each aerator.

Redundancy is not possible for the Huber vertical fine screen. Furthermore, if screening didn't occur for days or even a few weeks while the unit was down for repairs, the WWTP would continue to operate as it is now with the consequence being less reliable lift station pumps and continued pumping of inorganic solids and wastes into Cell 1 of the treatment plant. This screen comes equipped with an automatic bypass in the event of plugging or loss of power. Maintenance of the screen is usually accomplished by removal since it can be installed on a slide rail system for easy removal. More discussion of this screen was given in Section 3.4 of the Preliminary Engineering Report for Final Lift Station Replacement Including Provision for a Future Vertical Fine Screen submitted and approved by DEQ in May of 2013 in connection with the overall large collection system improvements project (Schiess & Associates).

4.3 Equipment Type, Size, Performance Criteria and Power Requirements

As indicated in Subsection 4.1 above, the type of aeration device recommended is an aspirating mechanical floating aerator. Manufacturer information for these units is provided in Appendix C. These devices are designed for shallow depth lagoons such as the City's lagoons.

These units will not erode the clay seal in the bottom of the lagoons. The lagoon depths taken from the facility plan are as follows:

Cell 1 - 5.5 feet Cell 2 - 5.8 feet Cell 3 - 6.2 feet

The aspirating devices should be mounted on a pontoon system that keeps the motor out of the water and the spinning propeller submerged. The movement of the water created by the spinning propeller creates a draft that draws air through the hollow shaft. The air exits the shaft and is broken into very small bubbles by the propeller. The tiny air bubbles are dispersed into the water by the violent mixing action created by the propeller.

Available power at the WWTP is three phase 240 Volt. The floating aspirating aerators should be supplied with this power. It would be best to purchase units equipped with 480 V capabilities in case the City upgrades its lift station and shop power service to 480 V.

4.4 Structure, Equipment and Piping Layout

Figure 4 gives the aerator layout for all the lagoons. This figure supersedes Figure 5-4 in the facility plan. The layout is simple with two five horsepower units suspended from a stainless steel cable that spans the lagoons and is duplicated three additional times.

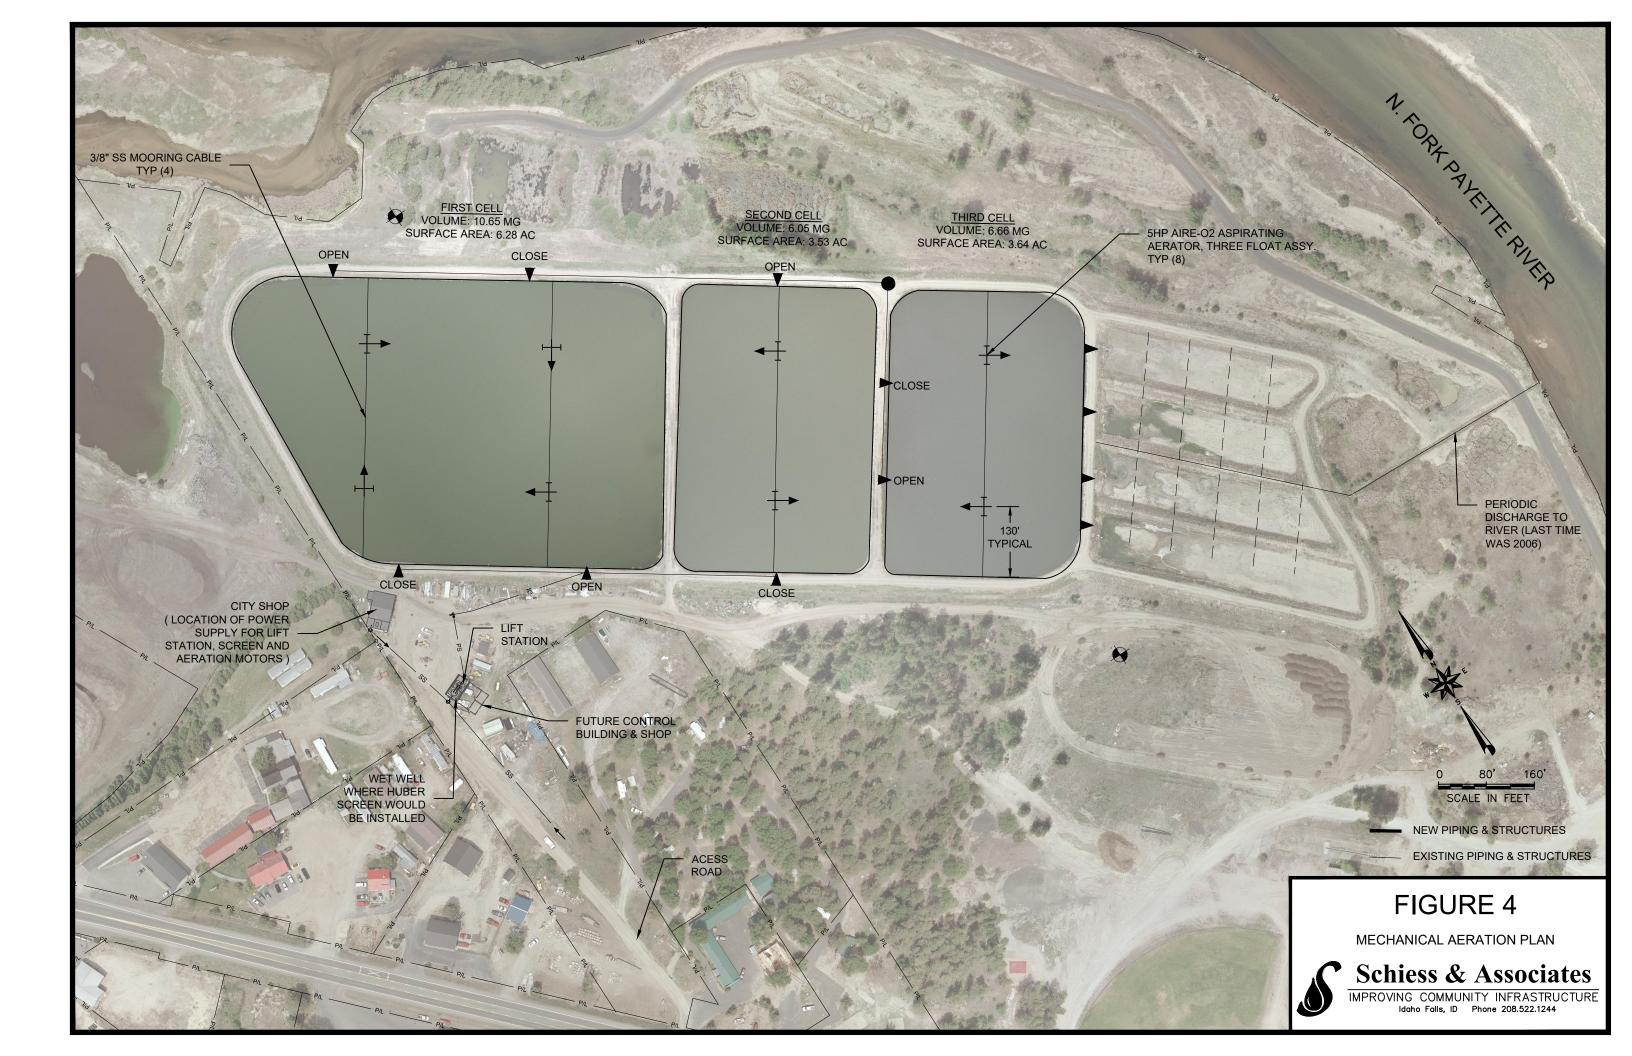

The wet well at the final lift station was designed around the future addition of a Huber RoK4 500 vertical fine screen. Attached plan sheets C-6 and C-7 from the lift station record drawings illustrate how the screen should be placed in the wet wall. Support systems and access were previously constructed with the wet well. Installation of the screen should not be difficult. Installation of the slide rail system would make maintenance easier for the operators.

4.5 Cold Temperature Operation

The aeration equipment is designed for use in cold temperatures. The aeration aspirators are capable of operating year-round even in ice and snow conditions.

The Huber screen must be purchased with the cold weather package due to freezing issues of the above ground portion of the unit or a building constructed over it. The cold weather package is rated to function to a low of minus 20 degrees F. Huber has vertical screens operating in Wisconsin with the cold weather package. Perhaps it would also work in Cascade. If the vertical screen was installed outside with the winter insulation package, then a worst case scenario would be to cease using it during periods of the year where, through experience, the screen cannot function properly in the extreme cold periods of winter. This would potentially be up to as much as three months a year (December through February).

A building built around the wet well and screen would ensure year-round operation of the vertical screen as described in the facility plan. A means of retrieval out of the roof of the building through a hatch would have to be built into the building. National Fire Protection Association (NFPA) 820 – Standard for Fire Protection in Wastewater Treatment and Collection Facilities should be followed if the screen is placed inside of a building.

4.6 Startup Procedures

Startup procedures require initial testing to insure aerators are correctly positioned and that the electrical equipment is operational. Manufacturer also suggests one field day for factory representative to support startup and initial operations.

Startup of the vertical fine screen requires manufacturer field support. Manufacturer suggests two days on site for start-up, installation and training.

5.0 ESTIMATES OF COST

These estimates are budgetary level and prepared assuming that the City advertises for bids for the work and pays for the work with local funds. The bids would include the work of a licensed electrician and someone who is readily available to do trenching and burying of electrical conduits and a water service line. Further refinement may is possible if the City opted to do some of the work themselves on a piecemeal basis with limited professional engineering support.

Table 3 below is an estimate of probable cost for the purchase and installation of the aeration improvements recommended herein. Power for the aeration system would bypass the standby generator.

Table 3 – Estimate of Probable Cost for 40 Horsepower of Lagoon Aeration & Mixing

Item No.	Item	Qty	Unit	Unit Cost	Ext. Cost
1	Aeration equipment- (8) 5 Hp aspirating aerators (includes main panel and control components, mooring cable with end accessories and 1,250' of submersible electrical cable, factory startup and warranty)	1	lump sum	\$180,000	\$180,000
2	Electrical cables, pull boxes, disconnects, miscellaneous electrical equipment and installation	1	lump sum	\$71,000	\$71,000
3	Trenching & conduit	1	lump sum	\$41,000	\$41,000
4	Modify existing service to separate normal power and standby power loads and feed to control panel	1	lump sum	\$15,000	\$15,000
5	Deadmen for aerator mooring	8	each	\$1,500	\$12,000
6	Mobilization	1	lump sum	\$10,000	<u>\$10,000</u>
Subtotal					
Construction contingency at 10%					
Engineerin	ng @ 10% of construction				<u>\$32,900</u>

Total \$416,800

This estimate places all buried conductors in conduit and allows isolation for repairs of any of the eight aerators at any time.

Table 4 below is an estimate of probable cost for the purchase and installation of the vertical fine screen.

Table 4 – Estimate of Probable Cost for Vertical Fine Screen

Item No.	Item	Qty	Unit	Unit Cost	Ext. Cost
1	Huber RoK4 500 vertical fine screen (includes cold weather package, slide rail system, control panel and equipment, pressure sensor, startup and warranty). No building included.	1	lump sum	\$123,000	\$123,000
2	Installation of slide rail system	1	lump sum	\$10,000	\$10,000
3	Power installation including trenching, conduit and conductor	1	lump sum	\$5,000	\$5,000
4	Water service connection and line to screen, meter box, yard hydrant and insulation of service line to the screen connection	1	lump sum	\$5,000	\$5,000
5	Mobilization	1	lump sum	\$5,000	<u>\$5,000</u>
Subtotal	Subtotal				
Construction contingency at 10%					
Engineerir	ng @ 10% of construction				<u>\$14,800</u>

Total \$182,600

The lift station was prepared for this very screen. Power for the screen is readily available at minimal cost as reflected in the estimate.

6.0 CONSTRUCTION SCHEDULE

The construction schedule has not been determined at this time. The City must consider the financial impacts of the recommended improvements contained herein and then budget and schedule accordingly. The City may use this report and estimate of costs to determine budgeting and scheduling according to the 2018 and future budget cycles.

7.0 APPENDICES

Appendix A: Data

Appendix B: Design Calculations

Appendix C: Manufacturer Equipment Information

Appendix D: References

Appendix A: Data

- Flow Data for Period November 2014 to February 2017
- BOD and TSS Data for Period November 2014 to February 2017
- Septage Volumes for Period June 2014 to June 2015
- Concentration of Ammonia and Phosphorus at Cell 3 for Period November 2014 to February 2017

PRELIMINARY PROCESS DESIGN REPORT

AERATED LAGOON SYSTEM

Project Name: Cascade, Idaho

Design # 15-7-4748

Option: AIRE-O₂® Aeration System

4/28/2017

Designed by: Alan Rice, EIT, Aeration Industries International, LLC.

The enclosed information is based on preliminary data provided by the owner/engineer. This data has been reviewed and has been utilized as the basis of the following design recommendations. There may be unknown factors which would alter the design recommendation. Aeration Industries International assumes no responsibility for the validity or any risks associated with the use of modeling software or industry standard assumptions. Aeration Industries International assumes no responsibility for or liability resulting from the use of the recommendations provided as part of the subject design.

Copyright 2017, Aeration Industries International

1. Design Specifications

1.1 Average Flow Rates

The biological process unit has been designed for a 24 hour / 7 day flow. No peaking factor has been assumed.

The peak hydraulic flow is assumed to represent an increase in hydraulic load only – not organic load.

DESIGN PARAMETER	FLOW	UNITS
Winter Flow (Average Day Max Month)	544,200	gpd
Summer Flow (Average Day Max Month)	238,000	gpd
Peak Hydraulic Flow	720,000	gpd

1.2 Influent Water Quality

The aeration system has been designed around the following influent water quality values provided by the engineer.

PARAMETER	INFLUENT	UNITS
Summer BOD ₅	501	ppd
Summer TSS	414	ppd
Winter BOD₅	618	ppd
Winter TSS	1024	ppd

1.3 Effluent Water Quality

Effluent requirements were taken from NPDES permit ID 002316-7

PARAMETER	EFFLUENT	UNITS
BOD ₅	30	mg / L
TSS	30	mg / L
TKN	-	mg / L

Note: The lagoon is not designed to achieve nitrification.

2. Design Considerations

2.1 Pre-Biological Unit Process

Neutralization is recommended / required ahead of the biological unit process if the pH is expected to fall outside of 6.5 – 8.5 for significant durations.

1/4" fine screen solids removal / reduction is recommended prior to the biological unit process (by others).

2.2 Biological Unit Process Aeration

The aeration system has been designed to provide 1.8 lbs O₂/lb BOD₅ on a removed basis at the design flow. No wind, surface, or algae effects have been assumed.

The aeration system has been designed to support a maximum process oxygen demand of 80 lb O_2 /day.

The lagoon system kinetically designed to achieve sufficient BOD removal. All three cells are designed to supply the minimum amount of mixing required to prevent algae growth and odor.

2.3 Process Conditions

It is assumed there are no significant fluctuations in the operating water level. If significant water fluctuations are expected to occur, Aeration Industries recommends using swing arm assemblies to allow the aeration equipment to fluctuate with the water level.

2.4 Process Description

Aeration Industries recommends installing four (4) 5HP Aspirating Aerators in the first treatment cell and two (2) 5HP Aspirating Aerator in each of the second and third treatment cells.

2.5 Process Calculations

See attached.

Aeration Industries' calculations for determining the aeration equipment required to fulfill the oxygen and/or mixing demand of biological wastewater treatment systems

Note: The methods and data presented here are intended for use by the designer to estimate the power requirement for the oxygen demand using AIRE-O₂ aeration equipment. This method is not intended to cover every application. Questions can be answered by contacting AIII at 1-800-328-8287

Input Data (Blue Cells) **Description Project Name:** Cascade, ID Flowrate = 0.54 MGD Input flowrate Winter Flow Volume = 23.36 MG 2 Input volume BOD in = 136 mg/l Influent BOD 3 **Project Number:** BOD out = 30 mg/l Design output BOD 4 15-7-4748 NH₄-N Removal = 5 0 mg/l Design ammonia or TKN removal Other = 0.00 mg/l Notes: BOD total = 618.0 lb/day The average day, maximum month winter line 7 = (line 1) * (line 3) * 8.34 flowrate of 0.5442MGD was provided by the BOD net = 481.8 lb/day line $8 = (line 3 - line 4) \times (line 1) \times 8.34$ NH_4 -N net = 0.0 lb/day line 9 = (line 5) x (line 1) x 8.34Effluent limits were taken from NPDES ID-Other = 0.0 lb/day line $10 = (line 6) \times (line 1) \times 8.34$ The winter maximum month organic load of 618lb BOD / day was provided by the engineer. The BOD concentration was then calculated based on this design parameter and the flowrate. **ASSUMPTIONS** O_2 : BOD = lb O₂ / lb BOD 1.8 Typically varies between 1 and 2 11 The lagoon is not designed to achieve O_2 : NH_3 -N=12 4.6 lb O₂ / lb NH₄-N Typical value is 4.6 O_2 : Other = lb O₂ / lb Other An oxygen to BOD ratio of 1.8: 1 supplies sufficient oxygen for BOD treatment and complete stabilization of the biomass. 13 Depends on species O2 REQUIREMENT UNDER FIELD CONDITIONS (AOR) The operating DO concentration is modeled to be 2.0mg/L. This is a conservative design parameter. The actual DO level in the lagoon may not reach 2.0. Aeration efficiency will O_2 for BOD = lb O₂ / day 867.3 line $14 = (line 11) \times (line 8)$ 14 O_2 for NH_4 -N =lb O₂ / day increase at lower dissolved oxygen 0.0 line $15 = (line 12) \times (line 9)$ 15 concentrations. Aeration Industries International

To Paul Scoresby,

The City of Cascade is faced with unique challenges regarding the performance of their wastewater lagoon treatment system, and Aeration Industries believes that the installation and operation of our custom AIRE-O2 system, consisting of eight (8) 5HP aspirating aerators, will not only greatly improve the current performance of the wastewater system, but will also provide the city the confidence they need to ensure that the wastewater treatment infrastructure can handle an increasing population.

Aeration Industries has been recognized as an industry leader in aeration technologies and lagoon treatment systems since it was founded over 40 years ago, with our AIRE-O2 system being used in all 50 U.S. states and over 90 countries around the world. Aeration Industries would like to take a moment to comment on some of the advantages that the AIRE-O2 system has to offer.

Improved Effluent

Based on information provided to Aeration Industries, the existing wastewater lagoon system experiences poor quality effluent during the spring months due to a combination of spring turnover, winter melt, and other factors. The biological oxygen demand and total suspended solids measured in the effluent during this spring period will reach 40mg/L or greater, which is not representative of "clean water."

The proposed AIRE-O2 system is designed to achieve year-round treatment. Operation of the AIRE-O2 system during these spring months will allow the city to achieve a high quality effluent year-round.

Population Expansion

Aeration Industries understands that Cascade is a growing community, and that an increasing population over the design life of the plant is likely to occur. The AIRE-O2 system is designed to treat an increased capacity of wastewater that is estimated to be equivalent to an additional 200 homes.

Algae Control

If left unaerated and unmixed, it is likely the existing treatment lagoon will grow algae – especially during the warm summer months in Cascade. Algae may be harmful to the local ecosystem, and can be toxic to birds or other animals in the area that may come into contact with the treatment lagoon.

The AIRE-O2 system may be intermittently operated during the spring and summer months in order to prevent the likely algae growth. By aerating the water, the surface layer continually turns over and disrupts the photosynthetic process by which algae grows.

Odor Control

The AIRE-O2 system will provide a safety mechanism against offensive odors resultant of future expansion. If the organic load to the lagoon is increased due to population growth, but aeration equipment is not installed, offensive odors in the immediate vicinity of the lagoon may be an issue. These odors may be spread from the treatment lagoons and throughout the town by wind.

However, aerating the lagoon will prevent the growth of bacteria that produce hydrogen sulfide and other odor-causing compounds, thus preventing offensive odors before they are ever created. Similarly, operation of the AIRE-O2 system will reduce odors resultant of spring turnover.

Turndown

Although the AIRE-O2 system consists of eight aerators, it is not necessary to operate all of the aerators constantly. The aerators may be cycled and operated intermittently depending on seasonal variations, environmental conditions, and other factors, in order to reduce electrical consumption.

Examples where turning on/off units in reaction to the process include:

- 1. Turning on additional aerators when algae growth or odors become a concern.
- 2. Turning off one or more units during non-peak seasons when there is little tourism.
- 3. Cycling aerators on/off based on the dissolved oxygen level measured in the field.
- 4. Turning off aerators after the historically difficult spring months are over.

Every wastewater treatment lagoon has its own unique qualities and intricacies, and the modular nature of the AIRE-O2 system provides the city the maximum amount of flexibility to adjust the process to meet their unique challenges. Although 40HP of equipment is installed, the operational staff may choose to operate as little as 5HP or as much as the entire 40HP, based on his or her previous experience.

Operational Ease

Aeration Industries AIRE-O2 system is designed to be easily operated and require almost no maintenance. The AIRE-O2 system aerators consist of just 5 moving parts, and the recommended maintenance schedule takes just a few hours every year.

Future Limits / Equipment Reuse

The AIRE-O2 system is designed to achieve BOD and TSS reduction. It is not designed to remove ammonia or phosphorous from the system. In the future, if the city of Cascade must comply to strict nutrient limits, the lagoon system may be upgraded further to meet these limits.

Ammonia removal may be achieved through installation of Aeration Industries patented BIO-FFILM system, and phosphorous removal may be achieved through chemical precipitation.

In either scenario, AIRE-O2 aerators will be required in the upgraded system, and the proposed aerators may be reused in the upgraded lagoon.

Conclusion

Aeration Industries believes that the AIRE-O2 system will benefit the city of Cascade, both immediately in the spring months and in the future as the population grows. Aeration Industries looks forward to partnering with both Schiess & Associates and the city of Cascade to identify the most effective path forward to meet the city's unique wastewater challenges.

Sincerely,
Alan Rice, EIT

Appendix C: Manufacturer Equipment Information

- Aeration Industries Aire-O2 Aspirator Aerator Sales Brochure
- Aeration Industries Aerator Layout Plan, Aerator Shop Drawings and Deadman Post Detail
- Aeration Industries Equipment Summary, Budgetary Price for Aeration Equipment and General Terms and Conditions
- Huber Vertical Fine Screen ROTAMAT RoK4 Sales Brochure
- RoK4 500 Sample CAD Drawing
- Sheets C-6 and C-7 of Final Lift Station Record Drawings Illustrating Screen Placement
- Manufacturer's Budgetary Price for the Screen

The Aire- $O_2^{\ \ }$ Aspirator produces a horizontal and circular flow pattern, providing proven whole basin circulation. Improve your wastewater treatment with higher removal rates of Biochemical Oxygen Demand (BOD) and suspended solids.

With the growing use and challenge caused by supposedly flushable wipes and poor screening becoming an increasing issue, we have customized our 10-30hp Aire- $O_2^{\ \ \ }$ Aspirators with a larger stainless steel antifouling propeller and housing for low maintenance operation that excels in heavy debris conditions. The resilient, patented design forces water outward horizontally past the end of the shaft, creating a vacuum that draws atmospheric air down the shaft. The air is then dispersed in a large plume of fine bubbles to maximize oxygen dispersion and mixing. Flexible sizing and mounting options allow for easy installation in a variety of applications and consistent oxygen dispersion throughout the entire basin, regardless of its size or shape.

The Aire-O₂ aspirator aerator is simply designed, consisting of only a few moving parts... providing you with easy maintenance and peace of mind.

Aire-O₂® Aspirator Aerator

WHY CHOOSE THE AIRE-O,® ASPIRATOR?

- Trusted performance in challenging, heavy debris conditions
- Simple to install and portable; ideal for retrofits and upgrades
- Consistent seasonal performance
- No aerosols
- Offering 10-30hp Aire-O₂® Aspirators with larger stainless steel antifouling propeller and housing

FEATURING

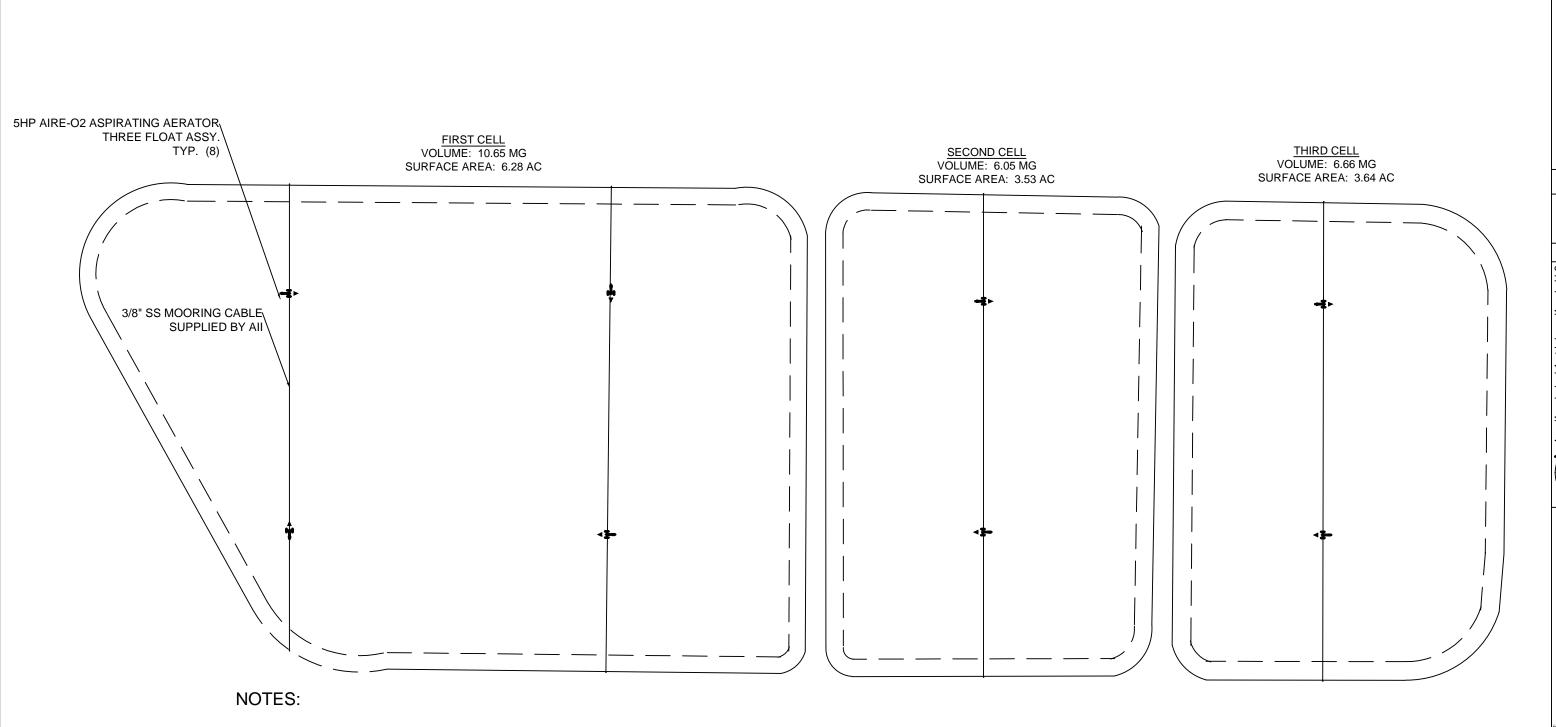

- Mixing and fine bubble aeration
- Variable mounting angle offers flexibility
- Three (3) year warranty for 2-100hp (7.5-22 kW) sizes in worldwide voltage, phase and Hz combinations
- Robust 1450/1800 rpm 4 pole motors allow for high velocity aspiration with extended motor life
- Field replaceable, water lubricated lower bearing with wear-resistant sleeve
- Wall, bridge mount assembly
- Housing mounted vortex shield available upon request

It has been a great relief to have dependable equipment that doesn't require babysitting."

COMPRESSED SATURATED GRANULAR WITH AN
ALLOWABLE BEARING PRESSURE OF 1000 PSF.
DO NOT PLACE IN ORGANIC SOIL (BLACK DIRT,
PEAT, ETC.) OR LOOSE SAND.

3. Equipment Summary

Eight (8) 5HP AIRE-O2® Aspirating Aerators, consisting of:

- 5 HP TEFC, 230/460 volt, 3 phase, 60 Hz, motor with motor heater
- Field replaceable, water lubricated lower bearing
- Field replaceable, wear-resistant sleeve
- 316 stainless steel three-bladed propeller
- 304 stainless steel diffuser and hollow shaft
- 304 stainless steel housing with mounting flange
 Note: Aerators shall arrive fully assembled for immediate mounting on flotation assembly.

Eight (8) Tri-Float Assemblies, consisting of:

- Three (3) molded low-density polyethylene, closed cell pontoon
- Stainless steel mounting hardware
 Note: Flotation devices require minimal field assembly.

One (1) Lagoon Control System, consisting of:

- NEMA rated free standing enclosure
- Main fuse disconnect
- 480/240-120VAC control transformer
- Power distribution box
- Eight (8) IEC contactor with adjustable ambient compensated overload relay
- Eight (8) NEMA 4X outdoor selector switch 3 position Run-Off-Auto
- Eight (8) NEMA 4X outdoor pilot light
- Eight (8) 24 Hour adjustable time clocks
- Underwriters Laboratories U/L 508 serialized label

Freight FOB to Jobsite
Field Service (one trip, one day)
Three (3) Year Warranty (See General T&C's)

BUDGETARY PRICE: \$179,749

EXCLUSIONS: Installation, duties and taxes are not included. DO controls and instrumentation,

cord grips, hand winches, mooring posts, and all items not specifically listed

above are excluded.

NOTE: If required, submittals will be done six weeks from receipt of purchase order.

Delivery is ten to twelve weeks from submittal approval.

Quotation valid for 30 days.

Three year non prorated warranty

TERMS: General Terms and Conditions Attached (2 pages).

AERATION INDUSTRIES INTERNATIONAL, LLC

General Terms and Conditions

- 1. **Price.** Published prices are subject to change without notice and shall not be binding on Seller until reduced to writing signed by Seller. All prices are F.O.B. Chaska, MN, and do not include transportation cost or charges relating to transportation, which costs and charges shall be solely the responsibility of Purchaser. Prices quoted include standard packing according to Seller's specifications. Special packing requested by Purchaser, including packing for exports, shall be paid by the Purchaser as an additional charge.
- 2. **Taxes.** To the extent legally permissible, all present and future taxes, imposed by any Federal, State, Local or foreign authority, which Seller may be required to pay or collect upon or with reference to the sale, purchase, transportation, delivery, storage, use or consumption of goods or services, including taxes upon, or measured by the receipts therefrom, shall be paid by Purchaser. Amounts covered hereby shall be added to the price, or billed as a separate item as the law may require or as the Seller may determine. No offset against or reduction in price shall be allowed Purchaser by reason of taxes owed, paid or payable by Purchaser, or charged by Purchaser's account.
- 3. **Credit and Payment.** Credit accounts will be opened only with firms or individuals approved by Seller's Credit Department. Unless otherwise provided, in any case where delivery is made on credit, Purchaser shall have thirty (30) days from date of the invoice in which to make payment for the goods. Seller reserves the right at any time upon notice to Purchaser, to alter or suspend credit, or to change the credit terms provided herein, when in its sole opinion the financial condition of the Purchaser so warrants. In addition, the Seller may at any time, with or without notice to Purchaser, and at its option, suspend work and shipment under this contract if, in the Seller's sole opinion, the financial condition of the Purchaser so warrants. In such cases, in addition to any other remedies herein, or by law provided, cash payment or satisfactory security from the Purchaser may be required by the Seller before credit is restored or Seller continues performance. If the Purchaser fails to make payment or fails to furnish security satisfactory to Seller, then Seller shall also have the right to enforce payment of the full contract price of the work completed and in process. Upon default by Purchaser in payment when due, Purchaser shall pay immediately to Seller the entire unpaid amounts for any and all shipments made to purchaser irrespective of the terms of said shipment and whether said shipments are made pursuant to this contract or any other contract of sale between Seller and Purchased, and Seller may withhold all subsequent shipments until the full account is settled. Acceptance by the Seller of less than full payment shall not be a waiver of any or its rights hereunder. The seller reserves the right, at its discretion, to charge up to 1½% per month for amounts not paid within stated terms.
- 4. **Cancellation.** Cancellation of orders once placed with and accepted by us can only be made by us. Should the Purchaser, due to change in design or other good and sufficient cause, desire to effect cancellation of the order, same will be accepted on the following basis:

Purchaser shall pay in full the costs of all material, dies, tools, patterns and fixtures provided for this order, that are on hand or for which we are obligated, together with all labor and other expense incurred in connection therewith. Invoices covering said costs shall be due and payable immediately upon our acceptance of cancellation.

- 5. **Patents.** To the best of our knowledge, the articles purchased hereunder do not infringe any Letters Patent granted to others by the United States of America or by any country foreign thereto. We do not assume any responsibility or liability for any claim of infringement brought against the Purchaser, its successors, assigns, customers or udders of its product. The Purchaser agrees to hold us harmless against any claim of infringement which arises out of compliance by us with specifications furnished by Purchaser.
- 6. **Risk of Loss, Title.** The risk of loss of the goods shall pass to the Purchaser as soon as they are deposited with the carrier for shipment to the Purchaser, but title to the goods shall remain in the seller until the purchase price therefore has been paid.
- of Seller's offer. Seller's obligation with respect to shipments of the goods shall not extend beyond a) putting the goods in the possession of such a carrier and making such a contract for the transportation thereof as may be reasonable having regard to the nature of the good; b) obtaining and delivering within a reasonable time such documents as may be necessary for Purchaser to obtain possession of goods; and c) notifying the Purchaser of the shipment within a reasonable time. Seller shall have the right to ship all of the goods at one time or in portions from time to time within the time of shipment. This contract shall be deemed separable as to the goods sold. Purchaser may not refuse to accept any lot or portion of the goods shipped hereunder on the grounds that there has been a failure to ship any other lot or that goods in any other lot were nonconforming. Any such default by Seller will not substantially impair the value of this contract as a whole and will not constitute a breach of the contract as a whole. The goods shall be deemed to have been tendered to Purchaser when they have been deposited with the carrier.
- 8. **Inspection and Acceptance.** Purchaser shall have the right to inspect the goods upon receipt of them and shall have the opportunity, at that time, to run adequate tests to determine whether the goods shipped conform to the specification of this contract.

Purchaser shall recompense Seller, at the contract price, for all goods used in testing and Purchaser shall bear any expense incurred in the inspection of the goods used in testing, whether or not the goods are non-conforming. Failure to inspect the goods or failure to notify the Seller in writing that the goods are nonconforming with ten (10) days of the receipt of the goods by Purchaser, shall constitute a waiver of Purchaser's rights of inspection and rejection for nonconformity and shall be equivalent to an irrevocable acceptance of the goods by Purchaser. Acceptance – Unless we receive notification to the contrary promptly from you, we will consider the foregoing conditions as been acceptable to you.

- 9. **Excuse in Seller's Performance.** This contract is subject to an the Seller shall not be responsible or liable for any delay directly or indirectly resulting from or contributed limitations on Seller's production, capabilities, prompt settlement of all details relating to the materials covered by this proposal, and to delays due to fires, explosions, acts of God, strikes or other differences with workmen, shortage of utility, facility, components or labor, delay in transportation, breakdown or accident, war and acts of war, compliance with or other action taken to carry out the intent of purposes of any law or regulation, changes, or revisions, accidents or any other causes or contingencies not caused by Seller or other which Seller had no reasonable control. In the event that any one or more deliveries hereunder is suspended or delayed by reason of any one or more of the occurrences or contingencies aforesaid, any and all deliveries so suspended or delayed shall be made after such disabilities have ceased to exist, and nothing herein contained shall be construed as lessening in any event the full amount of goods herein purchased and sold, but only as deferring delivery and payment in the events and to the extent herein provided for. Neither shall any delay in shipment be considered as a default under this contract or give rise to any liability on the part of Seller for items of incidental, special consequential damage unless such delay was directly and proximately caused by the willful and wanton act of gross negligence of Seller. Acceptance of material on delivery shall constitute a waiver of any claims against seller for damages on accounts of delay.
- 10. **Warranty.** Seller warrants that it will, at its option, repair or replace the goods, or return the purchase price thereof, which are found to be defective in material or workmanship or not in conformity with the contract requirements provided that, within three (3) year of shipment thereof, Purchaser gives written notice of such defect to Seller, the Purchaser returns the goods to Seller at point of original manufacture, with transportation charges prepaid by Purchaser, and an examination by Seller discloses to its satisfaction the existence of such defect or nonconformity with the contract requirements. In no event shall Seller be liable for any incidentals, special or consequential damages resulting from said effects or nonconformity. This warranty specifically excludes all labor charges that could be incurred.

THE FOREGOING DOES NOT APPLY TO COMPONENTS WHERE WERE NOT MANUFACTURED BY SELLER, AND IS EXPRESSLY IN LIEU OF OTHER WARRANTIES EXPRESSED OR IMPLIED, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE OR USE. THERE ARE NO WARRANTIES WHICH EXTEND BEYOND THE FOREGOING, NO AGENT, EMPLOYEE OR REPRESENTATIVE OF THE SELLER HAS ANY AUTHORITY TO BIND THE SELLER TO ANY AFFIRMATION, REPRESENTATION OR WARRANTY CONCERNING THE GOODS SOLD UNDER THIS SALES CONTRACT, AND UNLESS AN AFFIRMATION, REPRESENTATION OR WARRANTY MADE BY AN AGENT EMPLOYEE OR REPRESENTATIVE IS SPECIFICALLY INCLUDED WITHIN THIS WRITTEN AGREEMENT, IT SHALL NOT BE ENFORCEABLE TY THE PURCHASER.

- 11. **Remedies of Purchaser.** If goods are tendered which do not conform with the specifications under the sales contract and these goods are rejected by Purchaser, Seller shall have the right to cure the tender by either correcting the goods or substituting conforming goods. In the event that such substituted goods fail to conform to the contract or in the event of any other breach or repudiation of this contract by Seller, Purchaser shall not be entitled to recover any incidental or consequential damages as those terms are defined in Section 2-715 of the Minnesota Uniform Commercial Code and Purchaser's right to damages shall be limited to the difference between the contract and the market price of the goods as provided in Section 2-713 of the Minnesota Uniform Commercial Code. Purchaser shall not have the right to "cover" as provided in Section 2-712 of the Minnesota Uniform commercial code nor any rights to recover damages for any loss resulting in the ordinary course of events from nonconformity of tender as contained in Section 2-714(1) of the Minnesota Uniform Commercial Code.
- 12. **Assignments.** No right to interest in this contract shall be assigned by Purchaser, without the written permission of Seller, and no delegation of any obligation owned by Purchaser shall be made without permission of the Seller. Any attempted assignment of delegation shall be wholly void and totally ineffective for all purposed.
- 13. **Alterations, Interpretations and Definitions.** This contract shall be governed by the laws of Minnesota and is intended also as a complete and exclusive statement of the terms of their agreement. No course of prior dealings between the parties, and no usage of the trade shall be relevant to supplement or explain any term used in this contract. Acceptance or acquiescence to a course of performance rendered under this contract shall not be relevant to determine the meaning of this contract, even though the accepting or acquiescing party has knowledge of the nature of the performance and an opportunity for objection. Waiver by Seller of a breach by Purchaser of any provision of this contract shall not be deemed a waiver of future compliance therewith, and such provision shall remain in full force and effect. Any term used in this contract which is not defined herein shall have the same definition as that contained in the Minnesota Uniform Commercial Code.

Vertical Fine Screen ROTAMAT® RoK 4

Fine Screen with vertical lifting, dewatering and compaction of screenings

- Compact unit, easy to fit into confined spaces
- Prevents clogging of sewers and pumps
- Optional guide rails for easy and safe maintenance

>>> Challenge

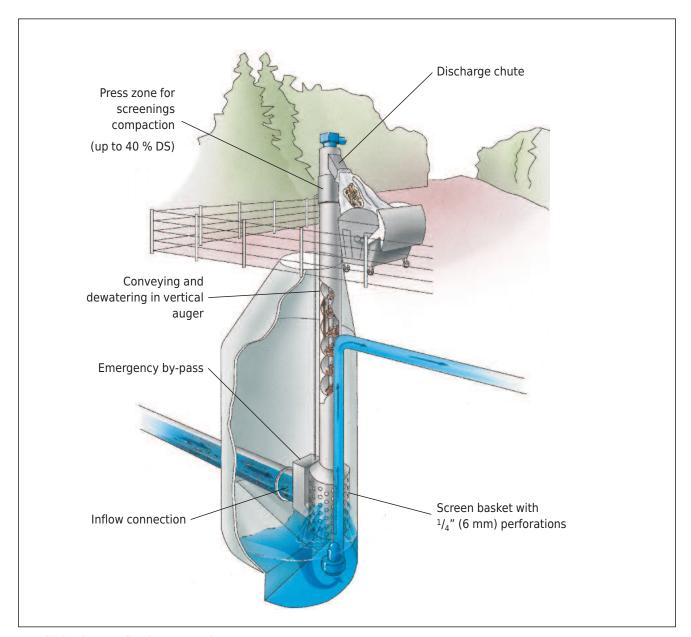

Pumps in lift stations require a lot of maintenance. Pumps with a large clear passage are used to prevent frequent clogging. However, those pumps have poor efficiency, particularly where the flow is low. Grinder pumps are subject to high wear, thus also requiring frequent maintenance in a narrow and dangerous environment.

Pump failure can lead to back-flooding in sewer systems, sometimes causing substantial damage.

>>> Solution

Upstream screening protects pumps from clogging and permits use of high-efficiency pumps. In addition, removal of coarse solids protects sewers by preventing deposits and reducing septicity, odor and concrete corrosion.

Our RoK 4 is the ideal screen for such applications. It is extremely compact and fits easily into confined spaces, such as wet wells and manholes. It vertically lifts the screenings, and dewaters and compacts them at the same time.

Installation in a confined pump station

Capacity

Size	Flow		
	[l/s]	[MGD]	
300	46	1.05	
500	120	2.7	
700	180	4.1	

>>> Features

The RoK 4 consists of a vertical screen basket and a shafted auger in a vertical tube. Wastewater flows through an inflow connection and a chamber into the screen basket. The top of this chamber is open and serves as an emergency bypass, e.g. in case of power failure. The inflow drops into the screen basket thus generating turbulence for the removal of fecal matter from solids (washing action). The drop also prevents back-flooding and solids deposits in the incoming sewer.

The screen is provided with 1/4" (6 mm) perforations; other sizes are available on request. When the water level in the screen basket rises above the invert level of the inflow connection, the auger revolves for a short time period. Within the screen basket the flights of the auger are equipped with a wear-resistant brush for effective cleaning of the screen.

As the screenings are gradually elevated by the auger, they are dewatered by gravity drainage. A screenings compaction zone is provided near the upper end of the

auger. Water is pressed out of the screenings through perforations in the vertical tube. Filtrate drains through a hose back into the inlet chamber. The compacted screenings are discharged through a chute into a container or endless bagger for odor control.

Benefits

- > Prevents pump clogging and failure
- Screening, lifting, dewatering, compaction and bagging in a single and compact unit
- > Single, easily accessible drive
- ➤ Excellent washing of fecals due to turbulent flow
- ➤ Optional frost-protection for outdoor installation
- ➤ Quick and easy installation into confined structures
- ➤ Easy retrofitting with little need for construction work
- ➤ Integrated bypass for power failure
- ➤ Sturdy design, reliable operation
- > Optional guide rail for easy and safe maintenance
- > Made of stainless steel, pickled in an acid bath
- Over a hundred installations

>>> Applications

- Headworks of small to medium size wastewater treatment plants
- ➤ Pump or lift stations
- > Sewer manholes or other sewer structures

>>> Examples

A few examples, selected from overone hundred RoK 4 installations.

Maximum Flow: 2.74 MGD Wastewater Plant Specific Flow: 1.75 MGD Wastewater Top of Well to Invert: 11 ft (estimated) Total Length: 22.64 ft (6900 mm)

Including:

- 304L Stainless Steel construction; pickled and passivated in acid bath
- Vertical screen basket
- Basket perforation: 1/4 in. (6 mm)
- Flights of screw equipped with wear resistant brush for effective cleaning of screen
- Shafted auger in vertical tube
- Integrated screening press
- · Automatic Press Zone Washing System with one (1) 1 in., Brass, C1D1 Solenoid Valve
- Class 1 / Division 1 Motor, 2 hp
- Closed Discharge Chute
- Bagging Unit
- 12 in. ANSI Flange Inlet Connection

RoK4 Main Control Panel

Including:

- NEMA 4X, 304 Stainless Steel Enclosure
- Main disconnect, non-fused with door handle
- FVR, IEC starter w/CB branch circuit [screen]
- PLC, Allen-Bradley MicroLogix 1400 w/required IO
- OIU, Allen-Bradley PanelView 300 Micro
- UL label
- Pressure sensor, 0-2 PSI with cable

Manufacturer's Services

Including:

- One (1) trip, two (2) days on site for start-up, installation, training, etc.
- Additional services are available on a per diem rate upon request
- Freight to site included

Price:

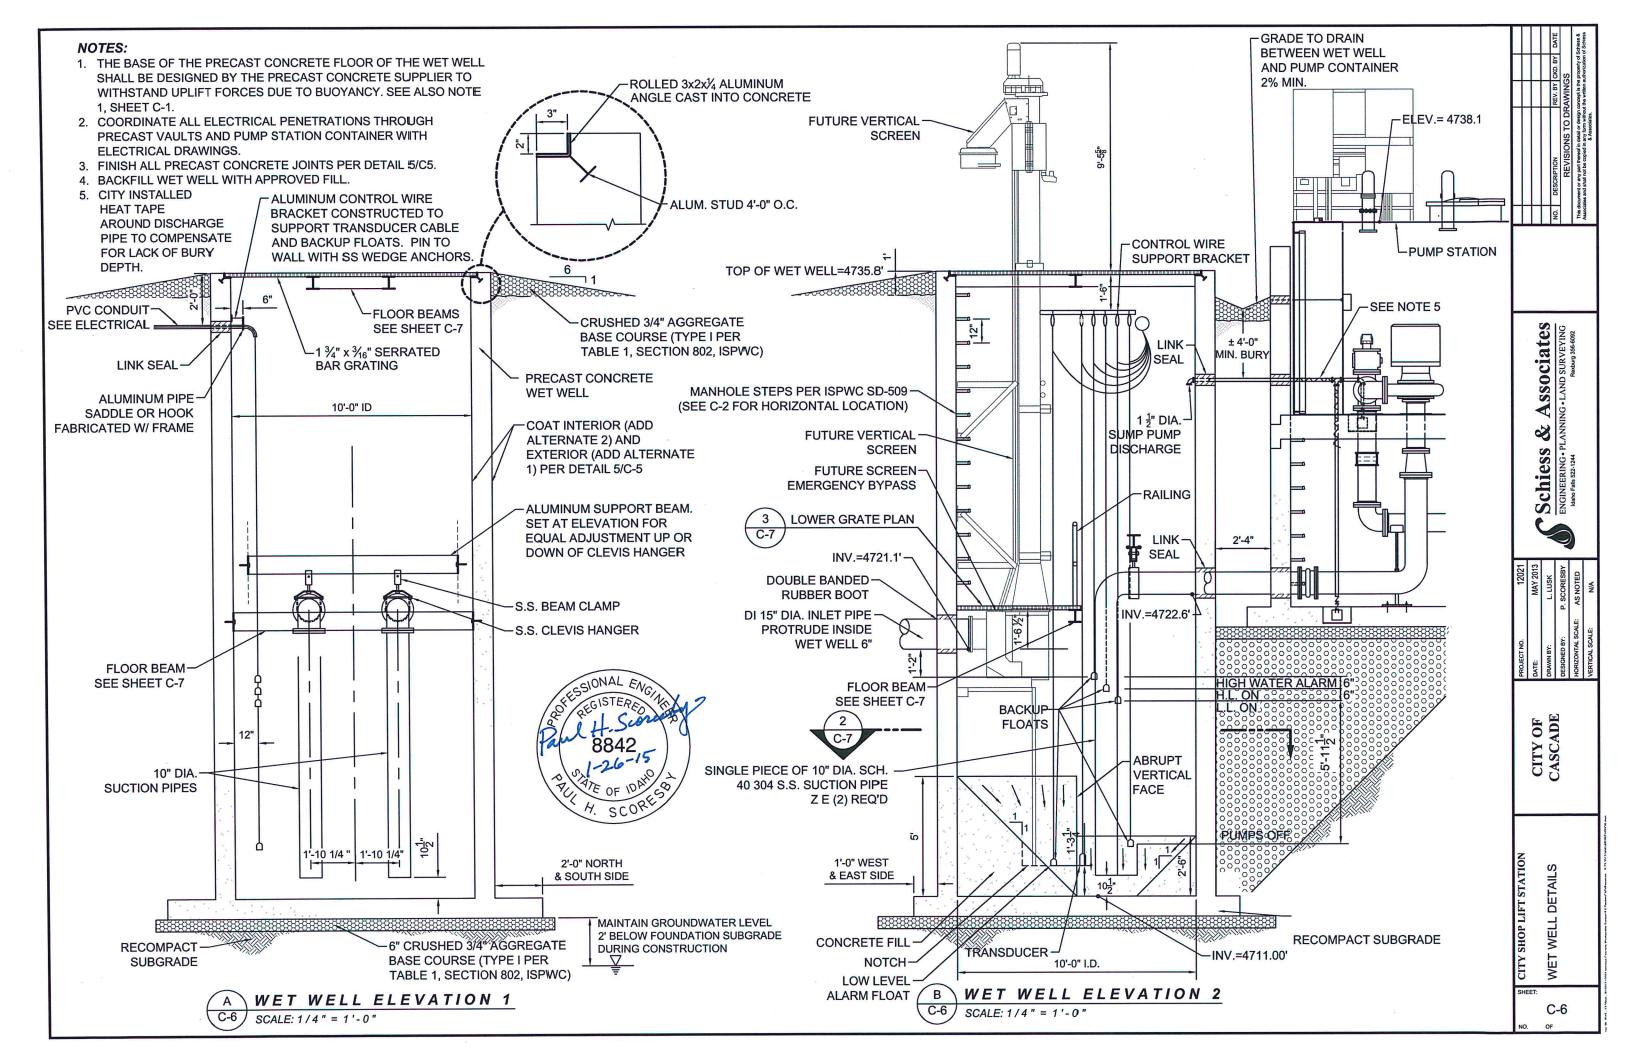

\$95,000 \$99,000

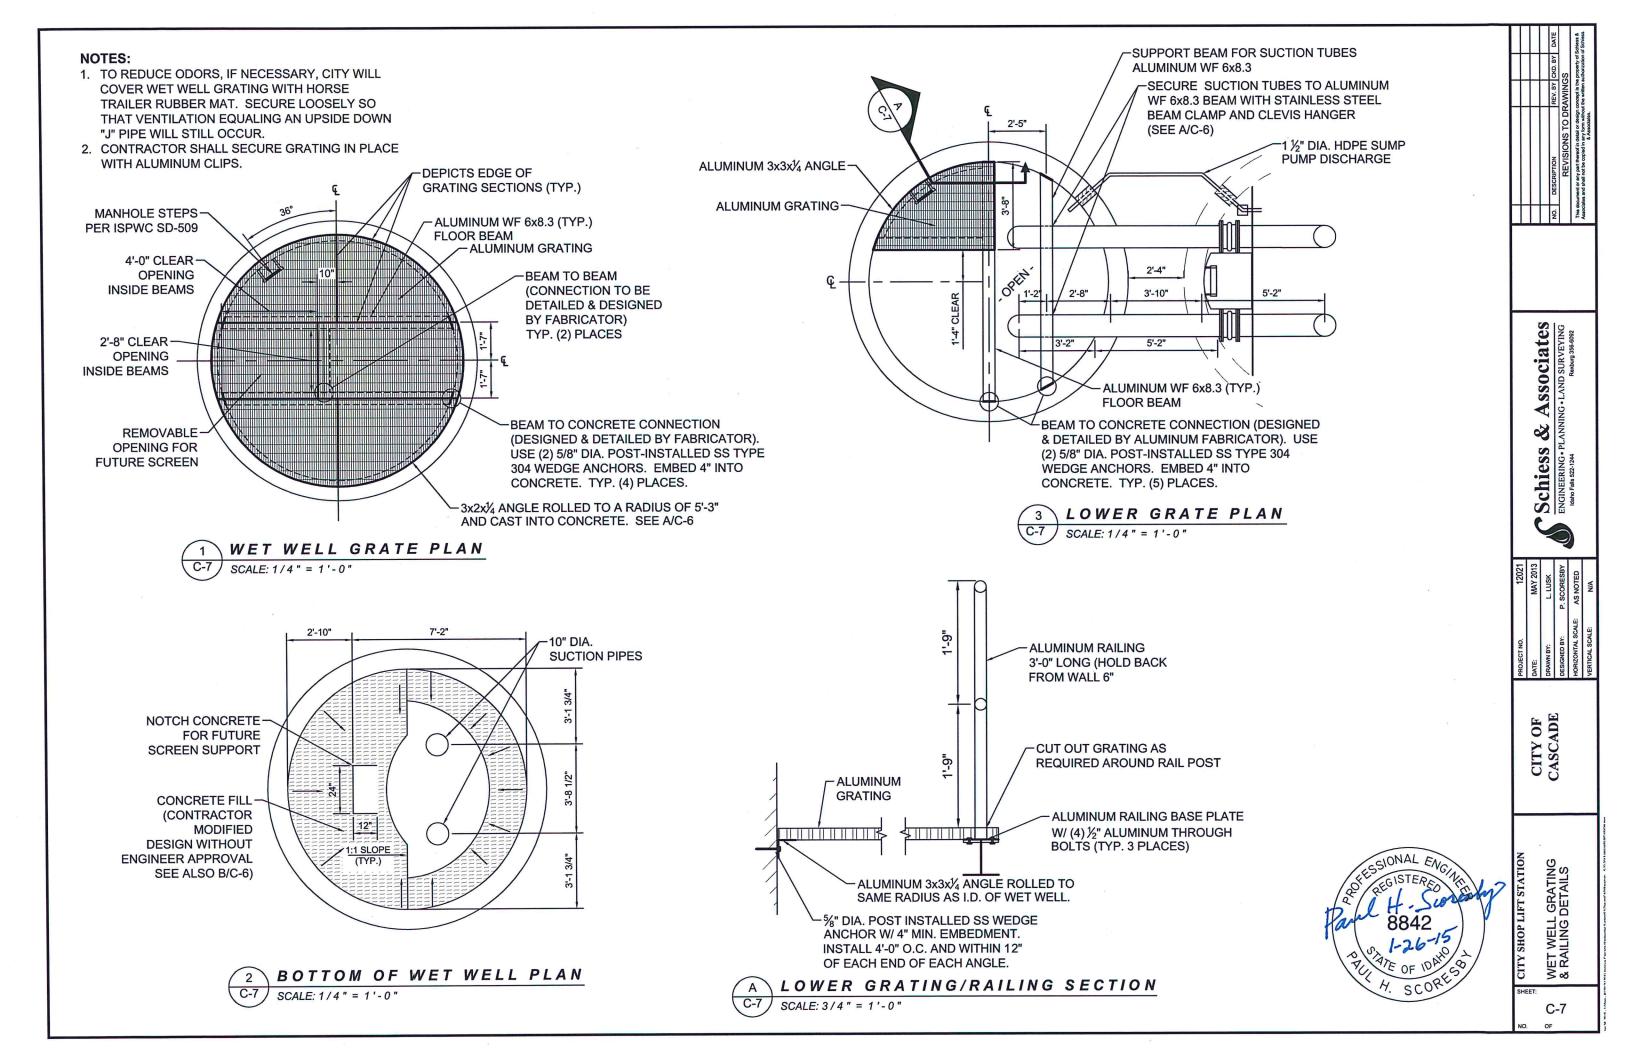

Optional: Lift In / Lift Out Device and Structure: +\$10,000 ADDER
Optional: Cold Weather Package Protection (to -20F): +\$14,000 ADDER

Notes:

- 1. Budget Proposal is quoted in US\$ unless otherwise stated.
- 2. Detailed Equipment Specification, Drawing, and Formalized Proposal are available upon request.
- 3. Huber recommends the lift in lift out device to facilitate removing the screen for any required maintenance
- 4. Machines made from 316L stainless steel or Duplex are available for a price adder for extremely harsh operating environments.
- 5. Proposal estimate is based upon Huber Technology's Standard Design, Terms, and Conditions. Any deviation from these standards may result in a price adder.
- 6. If there are site-specific hydraulic constraints that must be applied, please consult Huber Technology's representative to ensure compatibility with the proposed system.
- Huber's Cold Weather package list above includes heated motor windings, cold weather gearbox, heat tracing and insulation of the screens rising pipe and discharge chute. This can be had in C1D1 configuration
- 8. All of Huber's standard machines and systems are manufactured from 304L stainless steel. Huber makes no representation or warranties concerning the service life of the equipment against such abrasion or corrosion. The concentration of chloride and hydrogen sulfide (H2S) in the equipment operating environment shall be kept below the following values:
 - a. Chloride < 200 mg/l
 - b. Hydrogen sulfide (H2S) < 6 ppm
